Industrial Policy and National Security: A Model and Evidence

Geopolitics over economics

- Democracy and political freedoms
- "Not Cold War 2.0": Trade. Shock. Lifestyle
- Economic statecraft for the middle class
- Special place of industrial policy

Assess industrial policy and national security

- "Not to approve or disapprove, but to ask what is the smartest thing to do"
- Distort to improve
- Strategic policies

Case studies and statistics

- Varying λ: Japan, China
- CFIUS
- Statistics

Geopolitics over economics

Democracy and political freedoms

Business gets a scolding . . .

- "Newsflash: democracy is good for your business. Rule of law, here and around the world, is good for your businesses. It might make for a tough quarterly shareholder call, but in the long run, it's worth you working for us to defend our national security." (Raimondo, 2023)

. . . because before then:

- "International economic policymaking emerged as the near-exclusive province of economists and like-minded policymakers. No longer was it readily available to foreign policy practitioners as a means of working the US's geopolitical will in the world. (...) The consequences have been profound (...). China (...) and other countries now routinely look to geoeconomics as a means of first resort, often to undermine US power and influence." (Blackwill and Harris, 2016)

Urgency

Directed

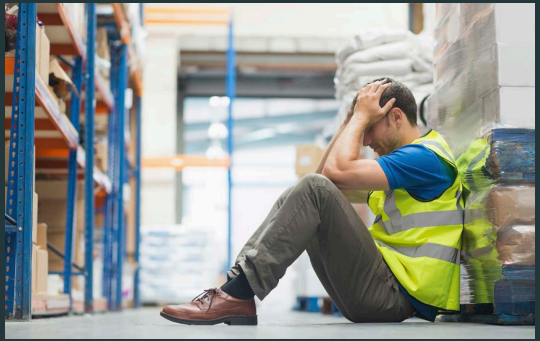
- US needs to “prevent a hostile hegemonic power from gaining ascendancy over the Asia-Pacific region”, as this would sharply restrict America’s freedom of actions and future prospects
- China’s “... ambitions to create an enhanced sphere of influence in the Indo-Pacific and to become the world’s leading power” (NSS, 2022)
- US leading the West in a campaign of “containment, encirclement, and suppression” (Xi, NPC 2023)

Figure 1: China’s FOBS allows nuclear warhead launch from hypersonic glide vehicles in orbit, 2021.

Economics is not that resolute anyway

New Economic Philosophy

- China Shock. “Stealing our jobs, hollowing out our industry, turning into ghost towns once-thriving American middle-class communities”
- **Not** every trade deal is a good deal; markets **don’t** always do the right thing; **not** all growth is good growth (Harris and Sullivan, 2023; Sullivan 2023)
- “economics will determine the US’s success or failure in geopolitics (...) when it comes to dealing with China” (Harris and Sullivan, 2023)



Whatever else it might or might not do, trade disrupts price ratios

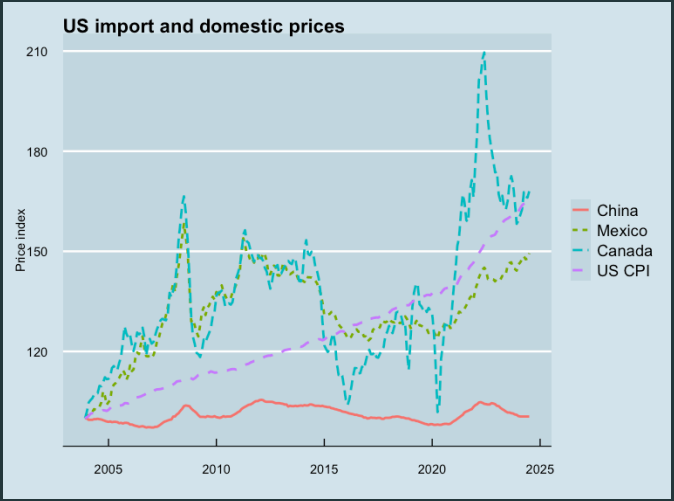


Figure 2: US import and domestic prices. The graph shows, from 2003 to 2024, prices of imports into the US from China, Mexico, and Canada, alongside the US Consumer Price Index.

Industrial policy and national security

”Something close to obvious”

Convention

- “Protectionism”, “market distortion”, . . .
- Unclear discipline

Model

- Generalized economic performance and national security interact
- Policies can industry-disrupt or industry-enable

Optimum security and industrial policy

- Not “anything can happen”
- Threshold effect: Range of inaction for low national security

Model

$$\max_{x=(x_0,x_1)} (1-\lambda)y(\omega(x)) + \lambda S(x) - p_0x_0 - p_1x_1 \quad \text{s. t. } x_0 \geqslant 0,\ x_1 \geqslant 0 \tag{1}$$

$$V_\lambda(x) = (1-\lambda)y(\omega(x)) + \lambda S(x) \tag{2}$$

$$\omega(x_0, x_1) \text{ has } \omega_0 = \frac{\partial \omega}{\partial x_0} < 0 \text{ and } \omega_1 = \frac{\partial \omega}{\partial x_1} > 0; \tag{3}$$

Comovement: National security; Industrial policy

Industrial policy x_1

- "Foreign policy for the middle class": Jobs creation; Inward investment
- Subsidies (especially if externalities, coordination costs, information failures)
- Climate change mitigation

Industrial policy x_0

- Tariffs
- Sanctions

National security λ

- Assessment
- Time pattern and activation

Optimum state policies for national security and industrial policy

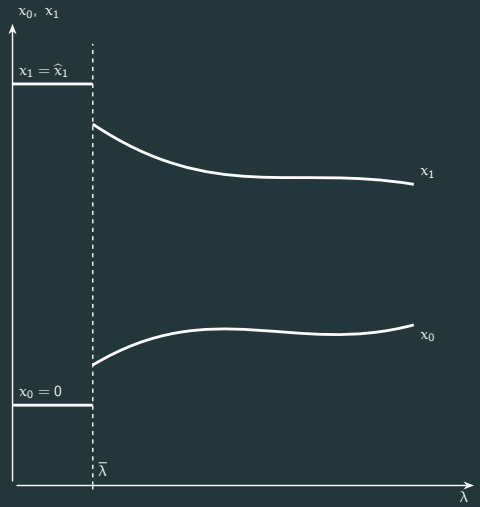

Figure 3: Industry-disrupting and industry-enabling policies as national security concerns rise.

Features

- Range of inaction for national security concern λ in $[0, \overline{\lambda}]$
- Monotone industry-disrupting x_0 in $\lambda > \overline{\lambda}$

Convex combination of indifference curves

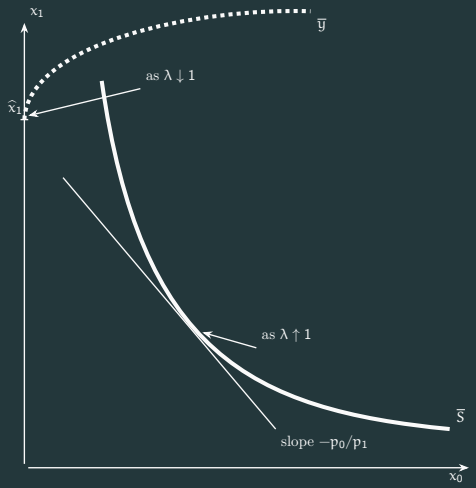

Figure 4: Industrial Policy and National Security optima

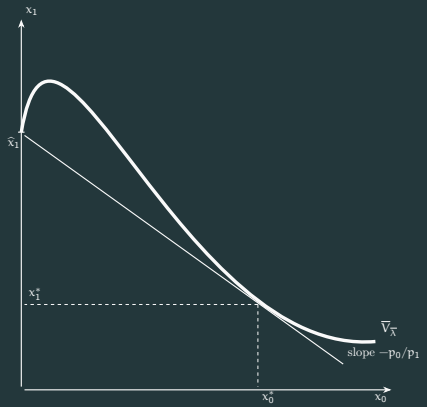

Figure 5: Integrated Performance optimum switching.

Case studies and statistics

Japan v China

A hostile hegemonic power, restricting America's prospects and freedom of actions? Or a liberal democracy, security partner, and treaty ally?

- Active industry-disrupting x_0 even when λ low
- Misleading announcements on λ
- Unclear "foreign policy for the middle class"

- "(...) should not expect to find a big American market because they don't make the things we want. They must find markets elsewhere for the goods they export"
- "largely a land of rule-bound rote learners", whereas "advances in information technology could only be made in free societies by free thinkers"

- "a locked and closed civilization that reciprocates our hushed fear with veiled contempt"
- "(...) the most serious, most somber, most challenging? It is that they are very, very good, better at some things than Americans. They are brilliant, efficient, aggressive people who prize education as much or more than Americans — and have learned to use it."

CFIUS

"CFIUS is an interagency committee authorized to review certain transactions involving foreign investment (...) in order to determine the effect of such transactions on the national security of the United States."

- Jobs creation ("foreign policy for the middle class")? Increased investment?
- Active industry-disrupting x_0 with unclear, ill-explained λ
- Nippon Steel 2025 (Biden blocked). Broadcomm 2008 (Trump blocked). Dubai Ports World 2006 (CFIUS and Bush approved, but Congress objected; DPW sold off).

Statistics

NIPO

1. x_0 import barriers: Developing countries 40%
2. x_1 subsidies: China 89%, EU 73%, US 46%
3. x_1 export subsidies: Japan 45%, ROK 28%

Official reason	USD bn
Strategic competitiveness	545
Climate change	318
Supply resilience	167
National security; geopolitics	102
Digital transformation	9
Total	1720

Table 1: Industrial policy and national security ($n = 24,000$). Announced subsidies 2024 by official reason, across all economies. Rows don't include all records; some announcements give multiple reasons. From NIPO, Global Trade Alert.

Conclusion

Industrial Policy and National Security: A Model and Evidence

Geopolitics over economics

- Democracy and political freedoms
- "Not Cold War 2.0": Trade. Shock. Lifestyle
- Economic statecraft for the middle class
- Special place of industrial policy

Assess industrial policy and national security

- "Not to approve or disapprove, but to ask what is the smartest thing to do"
- Distort to improve
- Strategic policies

Case studies and statistics

- Varying λ: Japan, China
- CFIUS
